

Serum C8 By Testosterone (Serum) Levels In Participants ≥ 6 And < 8 Years Of Age

C8 (ng-mL)

Testosterone (Serum)	Gender	N	Mean
NORMAL	Female	185	64.5470
	Male	459	82.2126
	Total	644	77.1379
HIGH	Female	304	69.4115
	Male	57	37.7316
	Total	361	64.4094
Total	Female	489	67.5712
	Male	516	77.2990
	Total	1005	72.5658

Serum C8 By Testosterone (Serum) Levels In Participants ≥ 6 And < 8 Years Of Age

Females: Normal 0-10, High > 10 (Units: ng/dL)
Males: Normal 0-20, High > 20 (Units: ng/dL)

The WVU website is a communication vehicle to depict associations or their absence for public use. These tables and graphs show many comparisons between lab tests and corresponding population serum PFOA (C8) levels. When it appears that there is a clear relationship between serum C8 and a clinical laboratory value, the meaning of that relationship still requires thought and discussion. Some of the relationships, while real, are weak and not likely to be important. Several are strong, interesting and potentially important, and none of them can be taken to show an etiologic (cause and effect) relationship or its absence without more work. When it comes to causes, scientists interpret these preliminary data with deference to additional work that needs to be done.

These data concerning associations are for public use. They will receive additional collaborative work in peer review format. We hope they prompt public curiosity and suggestions of interested scientists.
